- Title:** Nikola Tesla 1856-1943.
- Benchmarks:** Applied Sciences -- Science & Society -- Scientific Enterprise; Language Arts -- Reading -- Biography; World History -- Global Change & World Wars (1914-1945); World History -- Growth of Imperialism (1850-1914)
- Subject Terms:** TESLA, Nikola, 1856-1943; INVENTORS; ELECTRIC motors, Induction; ELECTRIC currents, Alternating; MAGNETIC fields; PATENTS; WESTINGHOUSE, George, 1846-1914; TESLA coils; INVENTIONS
- Authors:** Goldman, Phyllis Barkas
- Source:** Monkeyshines on Great Inventors; 1997, p13 (Click to view "Table of Contents") 3p, 1 graph, 1 map, 4 bw
- Publisher:** Great Neck Publishing
- ISBN:** 9781888325041
- Abstract:** Nikola Tesla was an inventor of many machines. His most famous invention was the induction motor, which uses alternating currents to generate power. During school Tesla began experimenting with alternating currents. He discovered the rotating magnetic field during this experimentation. In 1885 he sold the patents for his dynamos, transformers, and motors to inventor George Westinghouse. This caused Tesla's alternating-current electricity system to be in direct competition with famous inventor Thomas Edison's direct-current system. Tesla was granted over 110 patents in his lifetime. Tesla's inventions include, carbon button lamp, lighting systems, Tesla coil, etc. (Copyright applies to all Abstracts)

**Nikola Tesla 1856-1943**

Nikola Tesla was an inventor of many machines. His most famous invention was the induction motor which uses alternating currents to generate power.

Tesla was born in Croatia (part of the former country of Yugoslavia) on July 9, 1856 to an Orthodox priest and a homemaker. Growing up Tesla was always interested in technology.

After high school, Tesla first attended the Technical University in Graz, Austria and later graduated from the Univeristy of Prague in Germany in 1880.

During school Tesla began experimenting with alternating currents. He discovered the rotating magnetic field during this experimentation. This field is a magnetic whirlwind made in a motor by two or more currents coming together. The motor uses alternating currents to generate a large amount of electricity in one place.

In 1882 Tesla went to work in Paris, France for the Continental Edison Company. The company sent him to Strassburg, Germany in 1883 where he developed his induction motor. He used the principles of the rotating magnetic field and alternating currents to make it.

Tesla moved to New York City in 1884 with nothing but four cents and his ideas. He

found his first job with the famous inventor Thomas Edison, but the two had differing ideas, so he left.

In 1885 he sold the patents for his dynamos, transformers, and motors to inventor George Westinghouse. This caused Tesla's alternating-current electricity system to be in direct competition with Edison's direct-current system.

Tesla's system eventually became the accepted one for the electricity generation.

In 1891 Tesla earned his United States citizenship and finally had enough money to set up his own laboratory. In his lab he began experimenting with early forms of x-rays and worked on a carbon button lamp, electrical resonance, and different types of lighting.

The lighting systems Tesla developed were also used in Westinghouse's projects. This led to the company's contract to provide the power system for Niagara Falls which bears Tesla's name and patent numbers.

In 1891 Tesla also invented what is known as the Tesla coil. It is an air-core wire that is used as an electricity transformer at high voltages. This coil is used in radios and televisions. Its invention also led to Tesla's early developments of fluorescent lights and radio transmission.

In 1899 Tesla moved from New York to Colorado Springs, Colorado. In the year he lived there he created wireless lamps and generated bolts of lightning. He also discovered terrestrial stationary waves which are waves in the earth that allow the earth itself to be used as an electricity conductor.

Tesla returned to New York in 1900 and began to build a wireless world broadcasting tower.

This tower would allow communication throughout the world. People would be able to send pictures, messages, weather reports or stock reports to distant places in a moment.

Tesla found the money to fund his tower from the wealthy banker, J. P. Morgan. However, when Tesla began to have labor problems, Morgan worried and pulled out his funds. The failure of his tower proved to be Tesla's greatest disappointment.

Tesla was granted over 110 patents in his lifetime. However, in 1915 he fought Italian inventor Guglielmo Marconi for patent rights to many radio parts. Although he lost the case, in 1948 the United States Supreme Court invalidated the 1915 ruling.

Tesla received many honors for his achievements. In 1917 he won the Edison Medal, the highest honor given by the American Institute of Electrical Engineers. He also won the Elliot Cression Medal and the John Scott Medal.

The Nikola Tesla Museum was constructed in Belgrade, Germany and in 1956 the "tesla" (T) was created by the International Electrotechnical Commission. The tesla is a unit of magnetic flux density. Tesla also was awarded honorary degrees from Columbia and Yale Universities.

Nikola Tesla was known to be eccentric and compulsive. His circle of friends included such famous Americans as Mark Twain. Many people believed he was crazy for his claims to be able to communicate with other worlds, split the earth in half, and create a death ray. Tesla died on January 7, 1943 in New York City.

**[Tesla's Inventions Include:](#)**

- induction motor
- carbon button lamp
- lighting systems
- Tesla coil
